SEAMLESS SCADA SOLUTIONS — text left / gallery right

Seamless SCADA Solutions for Uninterrupted Operations

SCADA Solutions' flagship product, WindCapture™, is a Supervisory Control and Data Acquisition (SCADA) software package used for monitoring, controlling, data collection, and reporting for wind turbine generators (WTG). It was designed and tailored to the demands of manufacturers, operators, developers, and maintenance managers of wind energy projects and facilities.

Regardless of the make of turbines in your project(s), SSI customizes WindCapture™ with every installation to ensure the reliable flow and presentation of needed data. The system also combines a comprehensive database management system for standardized and customized operations reports with powerful analytic graphs, charts, tables, and other tools.

WindCapture™ has numerous usable, integrated functions. Key features include:

Scalability

WindCapture™ is engineered to handle any number of turbines and is easily upgraded to sustain any future growth. SSI can connect your projects and various farms together. Design platforms support projects with several different types of turbines.

Reporting

SSI's WindCapture™ systems provide real-time reporting with the highest degree of accuracy. Trend and analysis reporting, production curves, optimization graphs, and comparative analysis reports are a simple point-and-click away.

Automation

WindCapture™ offers an unprecedented level of automation. Automated curtailment easily handles curtailment setpoints from the power-outtaker, or CAISO.

Advanced GUI

WindCapture™ offers complete form-based GUI software that is remotely accessible and easily navigated by authorized operators.

Remote Access Capabilities

SCADA Solutions solves remote access challenges utilizing a technology platform that supports data reporting, alarms, and status updates via web, SMS, e-mail, or mobile platforms such as iOS and Android.

PROJECTS — Lalamilo Wind Farm

Take a Look at our Projects

Lalamilo Wind Farm

The Lalamilo Wind Farm integrates the Wind Energy produced on site to meet the power requirements needed to operate and monitor the various Department of Water Supply resources in the area.

These systems are uniquely specialized and are comprised of two independent SCADA systems working in parallel while communicating and sharing data to achieve maximum efficiency.

ADVANCED WATER TREATMENT — image left / text right

Advanced Water Treatment

Discover the power of SCADA systems, pivotal in enhancing water treatment processes through comprehensive real-time monitoring, precise control, insightful data analysis, and effective alert management. These advanced systems are designed to ensure unparalleled water quality and operational efficiency, safeguarding our most vital resource.

COMMUNICATIONS

DISTRIBUTED AUTOMATION — image left / text right

[communications.png]

Distributed Automation

SCADA Solutions has teamed with communications innovator Landis+Gyr, a worldwide leader in electricity metering and energy management, to integrate advanced radio technologies into the wind industry.

Distributed automation solutions require several key elements, from the end devices to the host application, with a strong communication network in between. Inherent features of the communication network include real-time two-way communications, scalability, reliability with self-healing capabilities, and a high level of security while being cost-effective.

SCADA Solutions' strategic partnership with Landis+Gyr allows delivery of the most advanced radio technologies available. Landis+Gyr has over 5,000 employees in 30 countries.

APPLICATIONS ENGINEERING — text left / image right

Applications Engineering

Our highly qualified applications engineers are experts in the application of fiber optic media, cables, connectors, and hardware. No matter how complex or challenging your requirements, our team can develop a custom solution that's reliable, mitigates risk, and helps speed up project implementation schedules. SCADA Solutions' engineers are skilled at designing the most advanced single- and multi-mode cable assemblies, guaranteeing to meet even the most stringent connector and cable specifications.

FIBER OPTIC TERMINATION — full-width dark section

[bg: fiber-optic-bg.jpg]

Fiber Optic Termination

SCADA Solutions is a leader in the application of cutting-edge fiber optic terminations and splicing methods. Our Applications Specialists can help you select the right component for each step in the termination and assembly process.

Customers have confidence that every assembly has been manufactured to your exact specifications using brand-name products, fully tested to international industry standards.

Available in any length, on spools when applicable:

- › 1-288 fiber cable in single-mode and multi-mode
- › Choose your connector type or combination
- › Cable available from industry-leading manufacturers

HARSH ENVIRONMENT ASSEMBLIES — text left / image right

Harsh Environment Assemblies

Mil-qualified assemblies are built to withstand the demands of the most rigorous environments and applications. These assemblies are ideal for any application where standard assemblies would be damaged by chemical, environmental, or physical stresses.

- › Hermaphroditic connectors for end-to-end connector flexibility
- › M28876 — designed for shipboard and ship-to-shore applications
- › D38999 — designed for tactical or industrial applications
- › Mil Spec ST-QPL Military ST fiber optic connector

SCOPE OF WORK PROCESS

Every project contains its own unique challenges. We custom engineer solutions, from the communications network and database storage to software design, installation, and support.

RESEARCH AND ANALYSIS PHASE

Research and Analysis Phase

We begin by gathering all documentation pertaining to the existing SCADA and communications systems from the client, as well as any information available on the turbine PLC hardware and software protocols. We then perform a site visit to evaluate the existing communications systems and all ancillary communications links. We will also determine infrastructure requirements and assess structural mounting specifications and installation requirements in accordance with the client's needs while on site. After completing our comparative analysis of all existing systems and determining feasibility options, we will make recommendations for necessary upgrades and/or retrofits.

DESIGN AND DEVELOPMENT PHASE

Design and Development Phase

Using the information assembled and conclusions achieved during due diligence, we will design and develop a complete

solution based on the scope of work. The detailed, professional programming of WindCapture™ is customized to the client's requests. This includes identifying the appropriate components and disciplines to integrate, configuration details, and installation specifications, and ensuring optimal efficiency and effectiveness of the final product(s).

BUILD OUT AND TEST PHASE

Build Out and Test Phase

Wherever applicable, and usually whenever possible, we will simulate as much as practical off site. We will set up all software and hardware components, mount and/or connect all equipment, communication cabling, fiber optics, radios, etc., and coordinate any ancillary needs from the client. We will then conduct off-site acceptance tests of the installation prior to start up. Acceptance test periods will vary depending on the complexity of the design.

ROLLOUT AND SUPPORT

Rollout and Support

Our experience ensures the complete and timely implementation of all network solutions and integrations with minimal disruption to vital business operations and functions. We will work closely with clients' field staff and management for a smooth installation through on-site pre-installation meetings, post-installation adjustments, and tech support.

Although the process seems tedious, these are necessary steps for a reliable system.

PROJECT MANAGEMENT

Project Management

Creating, coordinating, and deploying business solutions on time and within budget require a disciplined approach. As a result, with our experience in multiple fields of SCADA and communication systems, we have consistently evolved our methodology to meet the needs of our clients along with the demands of technology's growing pace.

Our project management program ensures project completion through all phases of research, design, development, construction, and deployment. Our team is always available and covers:

- › Quality Assurance
- › Status Updates
- › Integration Support
- › Timelines, Budget, and Scope Review
- › Communication Planning

Our end goal is to provide the products, services, and resources to help service our clients' requirements in any manner we can.
